

CO2Bit Tech and Madagascar Join Hands to address the Climate Change associated with declining CO2 Sequestration

January 16th, 2020 – CO2Bit Tech is an international dispersed group of technologists and philanthropists undertaking the creation and support of CO2Bit coin, a Network Based Digital Asset created as a mechanism to finance and promote the proliferation of sustainable carbon neutral energy generation projects and assets to enable evolving participation in our global economy for all.

The Joint Venture shall be formed for the purpose of utilizing CO2Bit coins as part of a finance mechanism within Madagascar for the sole purpose of addressing Climate Change associated with declining CO2 Sequestration within Madagascar through increased implementation of Agricultural Efficiencies, reducing the cutting and clearing of tree stands, Regulations and Economic Incentives for significantly reducing Commercial Deforestation, and increasing implementation of Solar Energy Grids to reduce the use of all CO2 emitting fuels.

Madagascar is committed to addressing Climate Change associated with declining CO2 Sequestration through increased implementation of Agricultural Efficiencies, reducing the cutting and clearing of tree stands, Regulations and Economic Incentives for significantly reducing Commercial Deforestation, and increasing implementation of Solar Energy Grids to reduce the use of all CO2 emitting fuels, within their purview.

The Minister of Environment from Madagascar signing the partnership with CO2 Bitcoin.

“In order to promote the reduction of CO2 in our atmosphere we need to continue to incentivize the appropriate climate behavior in all areas of the world. Every molecule of CO2 that is generated into our atmosphere matters and we need to make sure that we continue to provide the proper incentives to actors around the world. These inducements must be able to rise above local, national and even international politics in order to continue effectiveness. To do this we are looking to leverage the innate abilities and powers contained in block chain technology.” said Ron Wilkins, Chairman.

Currently, CO2 Bitcoins cost 60 coins per Ethereum or ~2 Euro per coin through the CO2 Bitcoin contract. “By creating a global currency who’s focus is on the reduction of these harmful gasses in our atmosphere we will be able to attack the problem on multiple levels and ultimately provide the financial support that we need globally to make a difference.” said Paul Opera, Chief Technologist.

As a participant in the Co2 Bitcoin currency ecosystem, by using the currency as a tool, CO2 Bitcoin holders will be able to participate on the world market to find ways to reduce the CO2 levels together. The coins generated in turn will be used for continued progression in new initiatives as well as to help the target initiatives promote their construction.
